

# Optimizing and decarbonizinging Africa's C&I microgrids through edge computing

June 20

## The urgent market opportunity

Diesel plug and play solutions outmoded and inefficient

Fuel prices have doubled

## Now businesses need data driven microgrids

Decarbonization requires Digitalization

## The gateway to the energy transition

The job of meeting Commercial & Industrial demand for decentralized energy falls on Energy Services Companies (ESCOs)

They develop, finance, commission, and operate & maintain renewable energy for offices, factories, telecom towers

## **ESCOs need:**

Lower customer acquisition cost Higher customer lifetime value

## **Digitization with Edge Computing**

End to end platform enabled by our energy management hardware.

#### **Pre-Commissioning**

#### Commissioning

#### **Post-Commissioning**

#### **Reduce CapEx**

 Right-sized solar and storage designs with energy audits captured by IoT power logger

#### Reduce Time to Market

- Shorten installation time of complex hybrid systems with Cortex Controller
- > Enable microgrid interoperability with the Circadian App

#### **Reduce OpEx**

- > Reduce fuel consumption by 15% through generator & battery optimization
- > Minimize site visits with predictive maintenance

## Digitalization across the value chain

## Transforming Businesses through actionable energy intelligence

## Case study Reducing OpEx for telecom towers

## Angola Case Study

Faster deployments and more profits for Angola's telecom tower operator.

## Solutions across the value chain 🞽

- > Commissioning
- > Compliance
- > Asset management

Genset usage optimization with 15% fuel savings, 3000L/yr
